Backfilling StoredModel AuditRecords Before ModelOp Center 3.4 Upgrade

Overview

This guide helps teams with existing environments that already have **StoredModels in production** before:

- Upgrading to **ModelOp Center 3.4**, and/or
- Have already **AuditRecords tracking** for StoredModel entities.

If AuditRecords were not enabled when models were promoted to production, those models may not appear correctly in the 3.4 Dashboard components and graphs.

To ensure dashboards display accurate production scenarios and metrics, you must manually create the expected **AuditRecord** entries with the original production promotion dates.

Solution Summary

For each StoredModel already in production:

1. **POST** — Create the AuditRecord
2. **PATCH** — Update the newly created AuditRecord to set the correct historical `createdDate`

This two-step process is required because the `createdDate` must be updated after the AuditRecord is created.

Step 1 — Identify the Production Model Stage

Determine which **modelStage** value is configured as the production stage in your environment.

On SCCS check the following configuration:

```yaml
modelop:
  model-stages:
    production-stage: prod
```

Notes:

1. The default predefined value is `prod` from within model-manage.jar application.yaml file.
2. The value is **case-sensitive**.
3. Use this exact value later in the API request.

Step 2 — Identify existing StoredModels in production

Identify StoredModels (or UseCases) that:

- Are already in production
- Do not appear correctly in the 3.4 Dashboard graphs

For each StoredModel, collect:

- StoredModel ID (UUID)
- Group (Business Unit)
- Desired production promotion date/time

Step 3 — Generate an OAuth2 Token

In secured environments, you must generate an **OAuth2 access token** using your OAuth2 client.
This token is required to authorize the AuditRecord creation request.

Step 4 — Create AuditRecord Entries

Send a POST request to create an AuditRecord for each StoredModel.

Replace the placeholders below with your actual values.

Required Values

- `<<MOC-BASE-URL>>` — ModelOp Center base URL
- `<<YOUR_GENERATED_OAUTH2_TOKEN>>` — OAuth2 access token
- `<<STORED_MODEL_GROUP>>` — StoredModel group (Business Unit)
- `<<STORED_MODEL_ID>>` — StoredModel UUID
- `<<PRODUCTION-MODEL-STAGE-VALUE>>` — Production stage value from config

Example cURL Request

```
curl -X POST "https://<<MOC-BASE-URL>>/model-manage/api/auditRecords" \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer <<YOUR_GENERATED_OAUTH2_TOKEN>>" \
  -d '{
      "group" : "<<STORED_MODEL_GROUP>>",
      "metaData" : {
        "custom" : { },
        "tags" : [ ],
        "modelStage" : "unassigned"
      },
      "entityId" : "<<STORED_MODEL_ID>>",
      "entityType" : "StoredModel",
      "changes" : [ {
        "op" : "remove",
        "path" : "/modelMetaData/tags"
      }, {
        "op" : "replace",
        "path" : "/modelMetaData/modelStage",
        "value" : "<<PRODUCTION-MODEL-STAGE-VALUE>>"
      } ],
      "storedModelId" : "<<STORED_MODEL_ID>>"
}'
```

Step 5 — Capture the New AuditRecord ID

From the POST response, capture the returned: `id`

You will use this value in the next step `(AUDIT_RECORD_ID )`

Step 6 — Update createdDate (PATCH — set historical timestamp)

Now update the AuditRecord with the correct historical production date.

This ensures dashboard timelines and graphs render correctly.

Step 7 — Update createdDate (PATCH — set historical timestamp)

Now update the AuditRecord with the correct historical production date.

This ensures dashboard timelines and graphs render correctly.

Each production date must use **ISO 8601 UTC format**:

> ISO 8601 UTC format,
>
> `YYYY-MM-DDTHH:mm:ss.SSSZ`
>
> Where:
>
> - YYYY = year
> - MM = month
> - DD = day
> - T = separator between date and time
> - HH = hours (24-hour clock)
> - mm = minutes
> - ss = seconds
> - SSS = milliseconds
> - Z = UTC timezone indicator

Example for December 30, 2025:

`2025-12-30T14:23:45.123Z`

PATCH Request — Update createdDate

Required Values

- `<<AUDIT_RECORD_ID>>` — Obtained as result from previous step.
- `<<YOUR_GENERATED_OAUTH2_TOKEN>>` — OAuth2 access token
- `<<MODEL_PRODUCTION_DATE>>` — Date when the Model made it into production

```
curl -X PATCH "https://<<MOC-BASE-URL>>/model-manage/api/auditRecords/<<AUDIT_RECORD_ID>>" \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer <<YOUR_GENERATED_OAUTH2_TOKEN>>" \
  -d '{
    "createdDate": "<<MODEL_PRODUCTION_DATE>>"
  }'
```

Step 8 — Verify Results

Successful requests should return:

```
HTTP 200 OK

```

After both steps complete successfully:

- Missing StoredModels should appear in dashboard components
- Production graphs will reflect correct historical promotion dates
- Dashboard metrics should match expected production scenarios

---

Example:

POST Request:

- `<<MOC-BASE-URL>>` — ModelOp Center base URL *(Not included for security reasons)*
- `<<YOUR_GENERATED_OAUTH2_TOKEN>>` — OAUTH2_TOKEN_HERE *(Not included for security reasons)*

- `<<STORED_MODEL_GROUP>>` — modelop
- `<<STORED_MODEL_ID>>` — a60bbdb0-6657-4bbf-8e93-e94083b07d07
- `<<PRODUCTION-MODEL-STAGE-VALUE>>` — prod

```

curl -X POST "http://<<MOC-BASE-URL>>/model-manage/api/auditRecords" \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer OAUTH2_TOKEN_HERE" \
  -d '{
      "group" : "modelop",
      "createdDate" : "2025-12-30T14:23:45.123Z",
      "metaData" : {
        "custom" : { },
        "tags" : [ ],
        "modelStage" : "unassigned"
      },
      "entityId" : "a60bbdb0-6657-4bbf-8e93-e94083b07d07",
      "entityType" : "StoredModel",
      "changes" : [ {
        "op" : "remove",
        "path" : "/modelMetaData/tags"
      }, {
        "op" : "replace",
        "path" : "/modelMetaData/modelStage",
        "value" : "prod"
      } ],
      "storedModelId" : "a60bbdb0-6657-4bbf-8e93-e94083b07d07"
}'
```

Response:

```
{
  "id" : "e0360ec4-37a6-41e0-a936-d4c713eb1d33", //<--Grab this value from Response
